

File error at first launch attempt:

Depending on your system's security settings, you may get a file error (code -35) the first time you unzip and attempt to run the software after downloading it from the Warthog website. I think this is because the 'Labhelper prefs' file remains inaccessible even if you have used the Security & Privacy option in System Preferences to allow access to the LabHelper app. LabHelper will report a -35 error if it can't find or open 'Labhelper prefs'.

One solution (there may be others) is to drag both the application and the 'Labhelper prefs' file onto the desktop and then launch LabHelper. Once this is done and the program has been run successfully, you should be able to move it (and the prefs file) into any folder you like.
